

Part IV: Applying Feedback

No matter how much experience you have, there's always room to improve a website. Feedback from your peers offers valuable insight into how real users experience your design, content, and functionality. Use this feedback as an opportunity to reflect, identify areas for improvement, and refine your site for better performance and usability.

Inside your **documentation** folder, create a new document called **lastname_peer_review1** where **lastname** should be replaced with your last name. Use this document to answer the questions below.

A. Content & Audience

Yes, my peer understood my site's purpose and the audience clearly. They said it was for URI students who want to find good study spots on campus, and that this came across right away. The suggestion they gave for content was to maybe add a page that lists actual study spots so students can see examples, not just general features.

B. Design & User Experience

They liked the design a lot. They said the colors looked good together, and that their eyes went straight to the logo. They also thought the layout and text were easy to read and organized well. Overall, they thought the design fit the purpose of the site and made it clear what it was about.

C. Functionality & Performance

The biggest issue they found was with validation. They said the HTML validator gave 68 errors, which might have also been why the desktop Lighthouse test had an error. For performance, the mobile score was low because of image delivery and cache times. They did say the site worked on both Chrome and Edge without any big differences, and that elements stacked well for smaller screens.

D. Accessibility & Usability

The feedback I got here was that while the site worked fine with keyboard navigation and the colors had good contrast, some images were missing alt text. They also said my forms needed labels and that the HTML pages should have a lang attribute. These are things I can fix to make the site more accessible and user-friendly.

E. Action Plan

My peer said the part they liked most was the visual design and color layout, since it was easy to read and looked clean. Based on their feedback, I'll focus on two main improvements:

1. Fixing my HTML and accessibility issues by cleaning up code, adding alt text to images, adding labels to forms, and making sure all files have a lang attribute.
2. Improving content by adding examples of study spots. I might not make a whole new page right now, but I can at least add some examples on the homepage so students get more useful info right away.

Use your peers' feedback to refine your website before submitting your midterm project. Be sure to fix all major issues, improve weak areas, and ensure your site is visually appealing, accessible, and fully functional.
